Organizational Silence in Healthcare

- Teamwork communication needs to be strong (Henriksen and Dayton 2006).

- A study which was conducted with OR teams showed that the doctors raise their concerns more than nurses and other healthcare professionals (Sexton etal. 2006).

Henriksen, K. ve Dayton, E. (2006). Organizational silence and hidden threats to patient safety. Health Services Research. 41 (42), 1539-1554.

According to the Yalcin and Baykal (2012)' s study with 220 nurses working at private hospitals;

1. Nurses are able to talk with their managers comfortably (75.5%)

2. Share problems mostly with their charge nurses (59.5%).

   - Nurses who are unhappy about work and thinking about leaving,
   - Unable to talk with their manager,
   - Had a fear of isolation

   Stay Silent

A study conducted with 913 front-line nurses from thirteen university hospitals in Turkey examining the relation between leaders' integrity and employee silence in healthcare organizations indicated that a manager's behavior should be constant while interacting with subordinates, (Erkutlu and Chafra, 2018).

Nurses' Work Enviroment

Hospital work environments that support the professional practice of nurses are critical to improve patient, nurse and system outcomes. Poor practice environment is related to high 30-day mortality and failure-to-rescue rates.

Nurse managers are responsible for creating these professional practice environments for staff nurses

Aiken, L. H., Clarke, S. P., Sloane, D. M., Lake, E. T. & Cheney, T. J. T. J. o. n. a. (2008) Effects of hospital care environment on patient mortality and nurse outcomes. 38 (5), 223. doi: 10.1097/01.NNA.0000312773.42352.d7

Determine the relationship between nurse managers' demographics and work-related factors that may affect the level to which nurse managers' exhibit silence behaviors.

Methods

- This descriptive cross-sectional study was conducted between March 2018 and September 2018 at a private hospital group in Turkey where 265 mid and senior level nurse managers were employed.

- 265 nurse managers, 169 who met the inclusion criteria were included in the study sample.

Method-2

- **Demographic Form:** 16 items questions the socio-demographic and professional characteristics of the participating nurses.

- **Nurse Manager Practice Environment Scale:** The scale developed by Warshawsky et al. (2013) was adapted to Turkish in 2017 by Tosun and Yıldırım who also conducted the reliability and validity study of the Turkish version of the scale.

- **Organizational Silence Behavior Scale:** The scale aimed at assessing the level of organizational silence was developed by Yalçın and Baykal (2019).

Abstract
Organizational silence maintained by professionals working in the healthcare sector could result in various moral dilemmas and might negatively affect patient care. The aim of this methodological study was to develop a scale that measured the organizational silence behaviors of healthcare professionals. During the development of the scale, researchers conducted in-depth interviews with 30 healthcare professionals in order to create a draft pool of 66 scale items. After content validity, a 62 item scale was drafted. In the second stage of development, psychometric properties of the scale were evaluated. The results of the confirmatory factor analysis indicated that adequate fit indices (χ^2 value to degrees of freedom = 3.54; goodness-of-fit index = .92; root mean square error of approximation = .90) were achieved and resulted in a 32 item scale with four subscales. These subscales were assessed using a 5 point Likert scale. The Cronbach's alpha for the scale was .93, and for the subscales, it was as follows: silence climate: α = .91, silence based on fear: = .91, acquiesce silence: α = .93, and silence based on protecting the organization: α = .85. The Organizational Silence Behavior Scale was successfully developed and showed satisfactory validity and reliability. It is usable among healthcare professionals.

Collegial relationships between NMs and physicians	2.0-6.0	5.05±.77
Effective NM- unit staff relationships	3.6-6.0	5.51±.50

Nurse managers spend most of their time engaging with their staff. The work environment should allow new ideas to emerge in order to ensure change and continuous quality improvement, to consider staff opinions and suggestions and to discuss mistakes in a free environment

Knowledge of financial planning is defined as a key competence for nurse managers However, nurse managers often state that they have insufficient knowledge and have almost no training prior to their management position regarding budget planning

Organizational Silence Behavior Scale	Min-max (1-5)	x̄ ±SD
Total Scale Scores	1.0-4.5	2.46±.69
Sub-scale scores		
Silence Climate	1.0-5.0	2.59±.77
Silence Based On Fear	1.0-4.8	2.05±.79
Acquiesce Silence	1.0-4.9	2.77±.92
Silence Based on Protecting the Organization	1.0-5.0	2.68±.90

The Organizational Silence Behavior Scale scores indicate that nurse managers occasionally stay silent. Their "acquiesce silence" subscale scores are the highest.

In this study, nurse managers obtained higher scores from the "acquiesce silence" subscale. A study conducted by Harmanci et. al. (2018) indicated that nurse managers tended to stay more silent than staff nurses regarding administrative and organizational problems. This finding can be interpreted as nurse managers accepting their situation and thinking they cannot change it, and as a result, they stay silent.

Conclusion

To the best of our knowledge, this is the first study examining the work environment and silence behavior of nurse managers.

This study found that the most affective factors for nurses remaining silent were;
- ✓ Found to be the work environment,
- ✓ The inability to express opinions freely
- ✓ Gender
- ✓ Having less than seven years of managerial experience.

Limitations

- This study was conducted in a one nation-wide internationally accredited hospital chain and the results are limited with this organization. The organizational culture might be an effect on communication styles within organization.

Implication for Practice

Determining organizational silence level and its effecting factors can be useful for hospital boards

- to make essential changes

- empower their managers to create a work environment with **open communication**.
